

BauMagtie

The BauMagTies are loops of magnetized steel wire that are slipped onto certain BauGrids at 4' on center (o.c.) before the BauGrids, with BauPositioners attached, are bundled. When the BauBundles are expanded, rebar can be quickly charged through the BauMagties held magnetically to the BauGrids.

A BauTietool is used to tighten the BauMagties to hold the rebar to only the BauGrids at 4' o.c. along the length of the BauCage.
