

## BauTree

The BauTree can be assembled on-site or assembled off-site with a hinged connection of the BauColumn BauGridCage to the BauBeam BauCage to make a Hinged BauTree. In both cases, the BauColumn rebar is charged into the BauColumn BauGridCage on-site.

The one-story BauTree has one BauBeam and the two-story BauTree has two BauBeams. The two BauColumn BauGridCages ride on top of the BauBeam BauCage during shipment. When the Hinged BauTree is lifted off the truck, it is turned (rotated) 180° so that the BauColumn BauGridCage is on the underside of the BauBeam BauCage.

The BauColumn BauGridCage is then rotated 90° to align with the openings in the BauBeam BauCage and the BauColumn rebar is charged into the BauColumn BauGridCage and through the BauBeam BauCage.

Two-story BauTrees can be easily assembled in a similar manner and erected very rapidly.

The BauTrees can also be shipped as PreFormed and/or PreClad BauTrees with BauValves at the base of the BauColumns so that concrete can be rapidly bottom-up pumped into the BauTree.
